What's New In?

Copy the IP (Internet Protocol) address of the current computer to the clipboard. The IP can be listed manually by opening the Network and Sharing Center or just type "ipconfig /all" in command prompt. When you copy the IP address to the clipboard, the string which shows your computer's IP can be pasted into any other application easily. All applications in Windows (except Windows Server, Windows CE) are capable of using IP address to identify a server. Clicking the button "Apply" will save your current IP address to the file you choose. Click the button "Cancel" to return to the previous window. The clipboard contains only one line of IP address. The source code of the program is free for everyone use. The application works in all Windows operation systems including Windows XP, Windows 2000, Windows NT. The Windows XP service pack 2 bug fixes it and it didn't show in program list either... Click to expand... Bug fix: After you fix the auto start (Copy IP -> 2), what's the IP address?(How to find out?) *before* I tried to "Get Program Data", and installed it here. I guess all the bug fix could be the one thing I didn't get in time to do? Sorry for the 'ugly bug', I guess a lot of people would hate to have such a 'bug' after a long time. In Edit->Options->Advanced->Registry Editing->Hive functions->Edit hive options->Network tab, and on the Internet Sharing tab. Problem is there are just two items on the list : IPv4 and IPv6 The rest is All shares and the Default share. I googled around for finding the solution but couldn't find it. All I found is I could go back to the properties of the "All shares" and "Default share" and set the "IP addresses" there to "Yes" if I want to turn the "IPv4" sharing on or off. And how can I find the IP address? I'm using Windows Vista Home Premium x64 Thanks for the help Last edited by syunzhun; 12th April 2010 at 08:56 PM. Reason: What IP address? // PLCSwitchView.h // PLCrashReporter // // Created by Paul Lloyd
